# Demonstration: importing a schema from a third party (sqlite)

#### **Resources:**

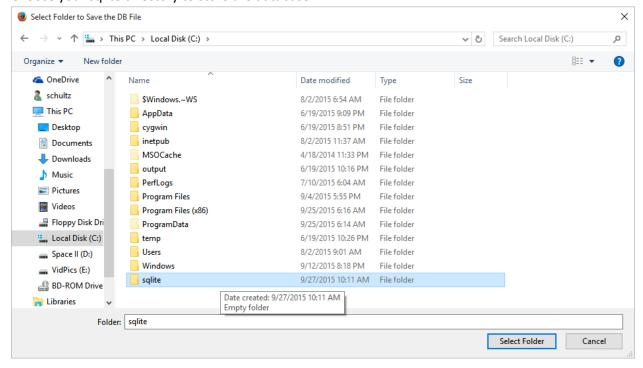

- Sqlite-manager for firefox: <a href="https://addons.mozilla.org/en-US/firefox/addon/sqlite-manager/">https://addons.mozilla.org/en-US/firefox/addon/sqlite-manager/</a>
- konagora sample database: <a href="http://edu.konagora.com/ajax/download.php?file=databases/moviedb-sqlite.zip">http://edu.konagora.com/ajax/download.php?file=databases/moviedb-sqlite.zip</a>
- modified sql file (removed transactions): <a href="http://onyx.csit.parkland.edu/~csc191/moviedb-sqlite-utf8.sql">http://onyx.csit.parkland.edu/~csc191/moviedb-sqlite-utf8.sql</a>
- 1. Make a new sqlite directory on your computer
- 2. Download the modified sql file from onyx to your sqlite directory
- 3. Click on "Database" and then "New Database"

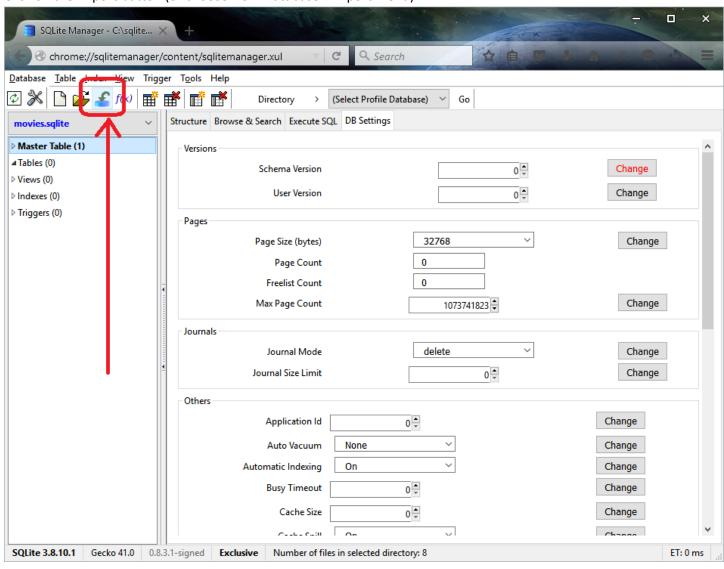

4. Give you new database a name

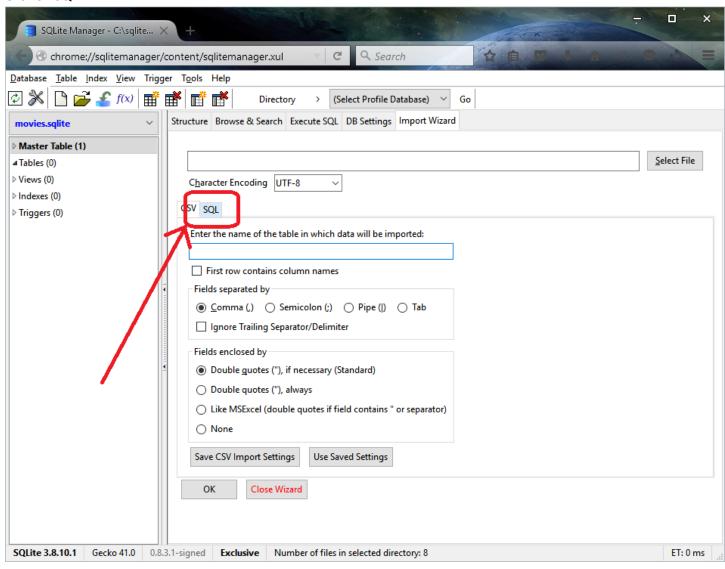

5. Choose your sqlite directory to store the database

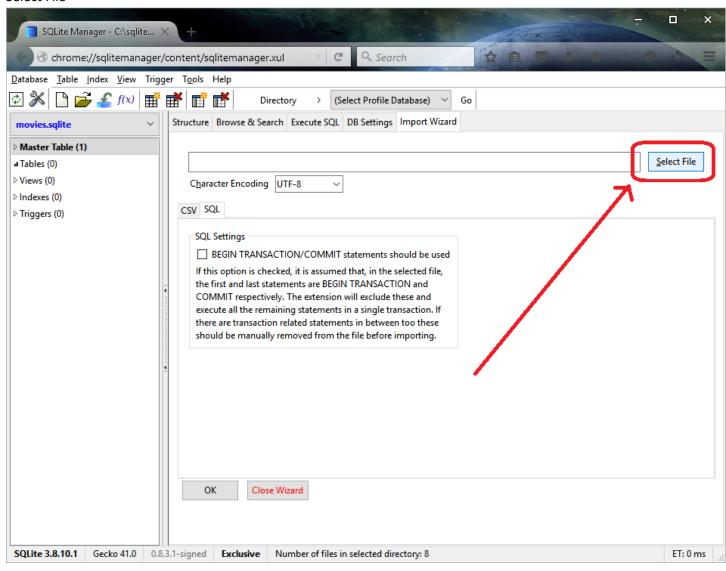

6. Click on the Import button (or choose from Database->Import menu)

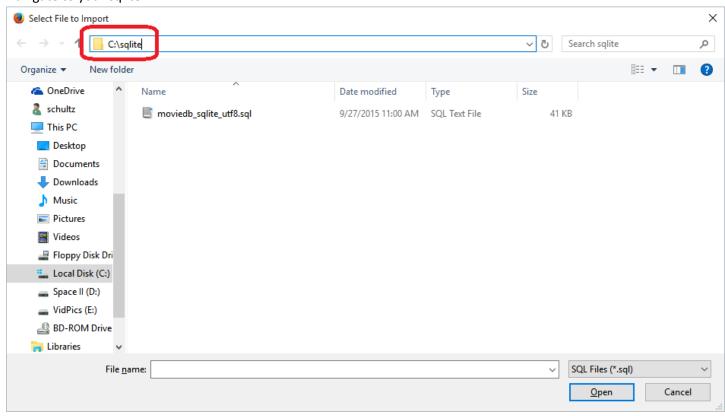

#### 7. Click on SQL

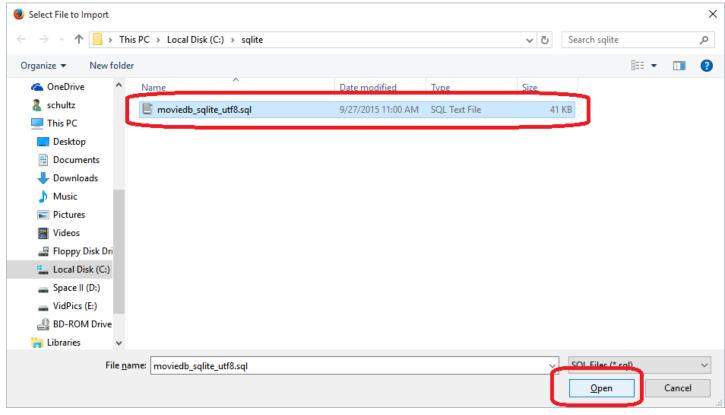

#### 8. Select File

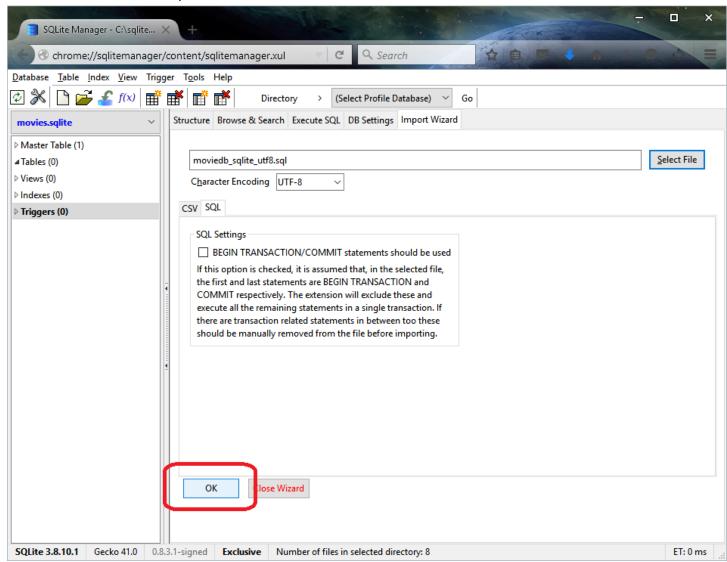

## 9. Navigate to your sqlite

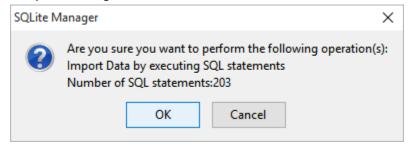

## 10. Select the sql file, and then Open

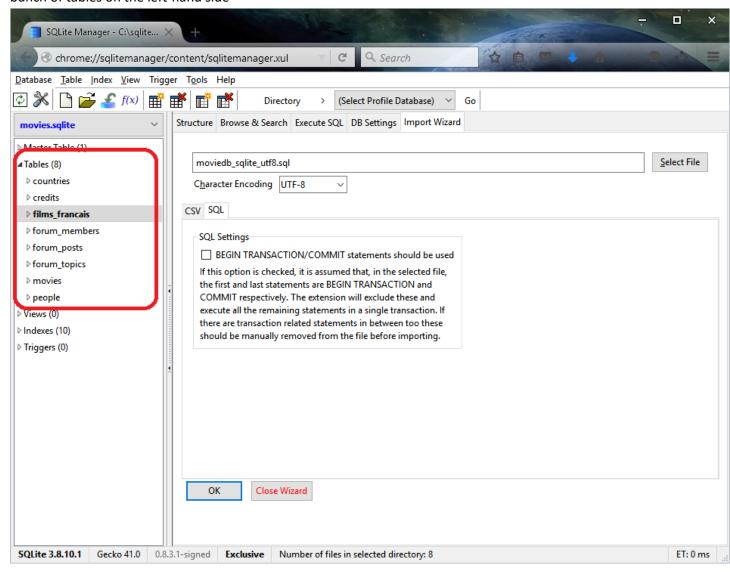

### 11. Select "BEGIN TRANSACTION/COMMIT" and click OK

## 12. Are you sure? \*grin\*

13. If all goes well, you should seem a brief message saying that 203 statements were executed, and you now have a bunch of tables on the left-hand side

14. You can see the columns on the left-hand side if you click the little arrow, and you can explore the tables via the tabs on the right-hand side, like "Browse & Search"
